A close-up photograph of several clear water droplets resting on a green, textured fabric surface. The droplets are spherical and reflect light, creating highlights and shadows. The fabric has a fine, woven pattern. The overall color palette is dominated by various shades of green and the clear, refractive colors of the water.

Concentration levels and congener profiles of polychlorinated biphenyls, pentachlorobenzene, and hexachlorobenzene in commercial pigments

Katsunori Anezaki · Takeshi Nakano

Received: 10 April 2013 / Accepted: 2 July 2013 / Published online: 14 July 2013

© Springer-Verlag Berlin Heidelberg 2013

Abstract The concentration levels and congener profiles of polychlorinated biphenyls (PCBs), pentachlorobenzene (PeCBz), and hexachlorobenzene (HxCBz) were assessed in commercially available organic pigments. Among the azo-type pigments tested, PCB-11, which is synthesized from 3,3'-dichlorobenzidine, and PCB-52, which is synthesized from 2,2',5,5'-tetrachlorobenzidine, were the major congeners detected. It is speculated that these were byproducts of chlorobenzidine, which has a very similar structure. The total

study detected a certain level of PCB-11, which is not included in PCB technical mixtures, and revealed continuing PCB pollution originating from pigments in the ambient air.

Polychlorinated biphenyl contamination of paints containing polycyclic- and Naphthol AS-type pigments

Katsunori Anezaki · Narayanan Kannan · Takeshi Nakano

Received: 2 March 2014 / Accepted: 28 April 2014
© Springer-Verlag Berlin Heidelberg 2014

Abstract This study reports the concentrations and congener partners of polychlorinated biphenyls (PCBs) in commercially available paints. Polycyclic-type pigments containing dioxazine violet (pigment violet (PV) 23, PV37) and diketopyrrolopyrrole (PR254, PR255) were found to contain PCB-56, PCB-77, PCB-40, PCB-5, and PCB-12, and PCB-6, PCB-13, and PCB-15, respectively, as major congeners. Dioxazine violet is contaminated with by-products during synthesis from *o*-dichlorobenzene, which is used as a solvent during synthesis, and diketopyrrolopyrrole is contaminated with by-products during

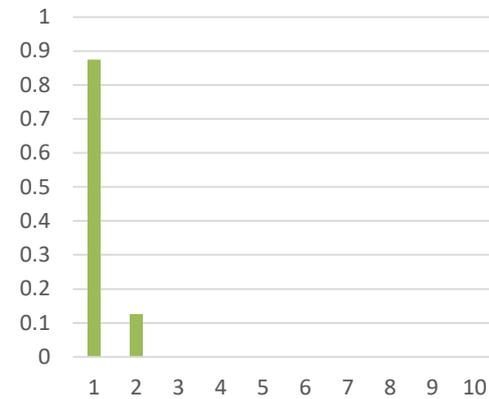

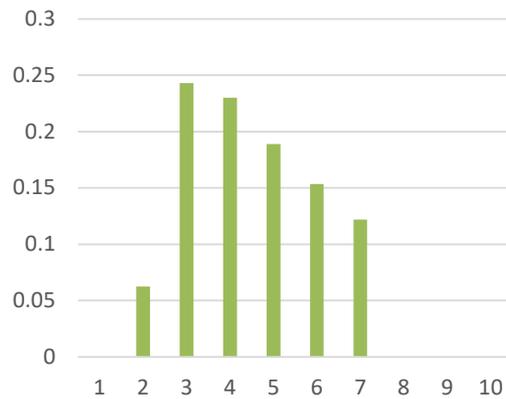

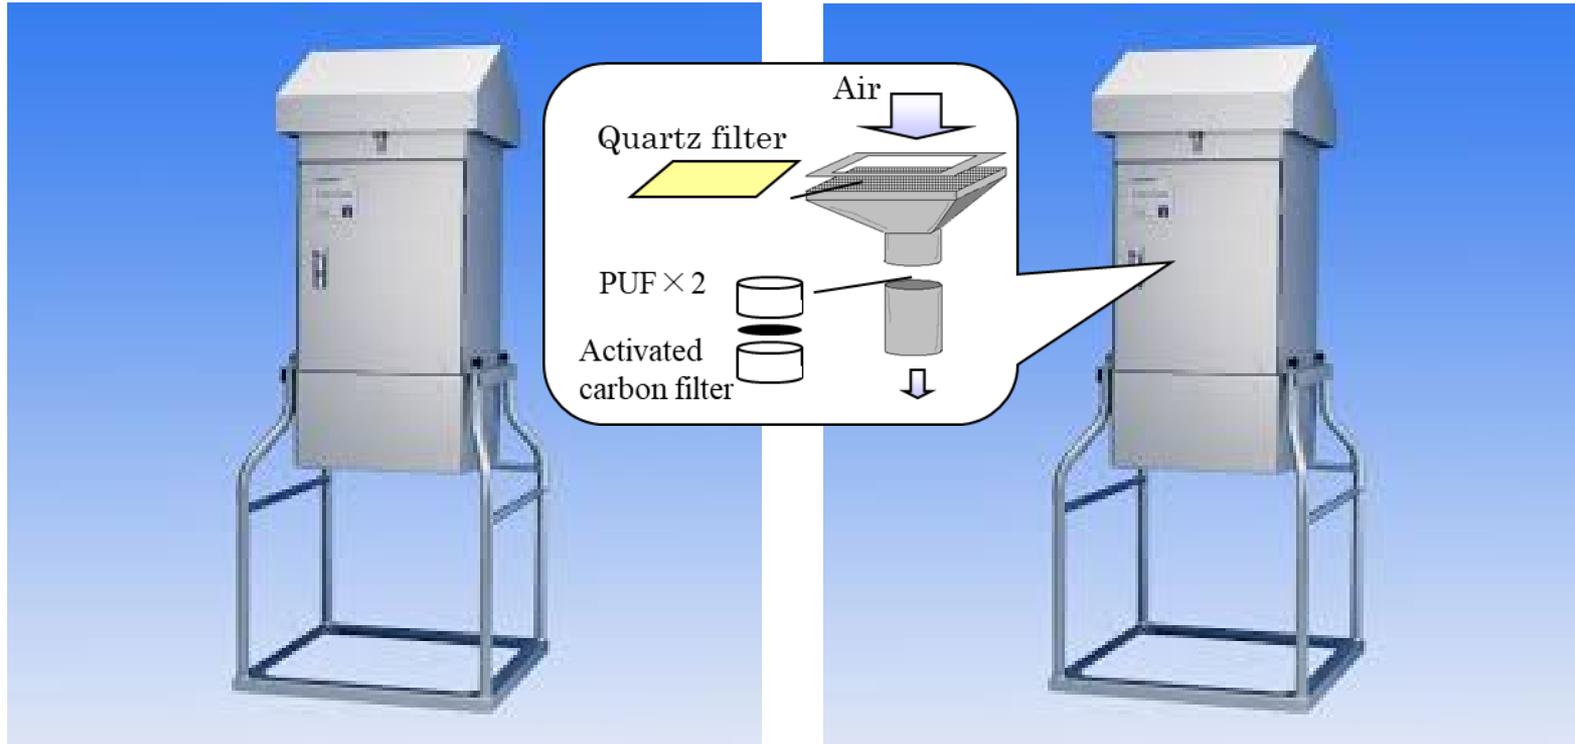

3.8 mg/kg, respectively. The corresponding TEQ for PR112 was 0.0039–8.6 pg-TEQ/g.

Keywords Polychlorinated biphenyls · Congeners · Pigments · Dioxazine violet · Diketopyrrolopyrrole · Naphthol AS · By-product

Unintentional PCB in chlorophenylsilanes as a source of contamination in environmental samples

Katsunori Anezaki^{a,*}, Takeshi Nakano^b

^a Hokkaido Research Organization, Environmental and Geological Research Department, Institute of Environmental Sciences, N19W12, Kita, Sapporo, Hokkaido, Japan

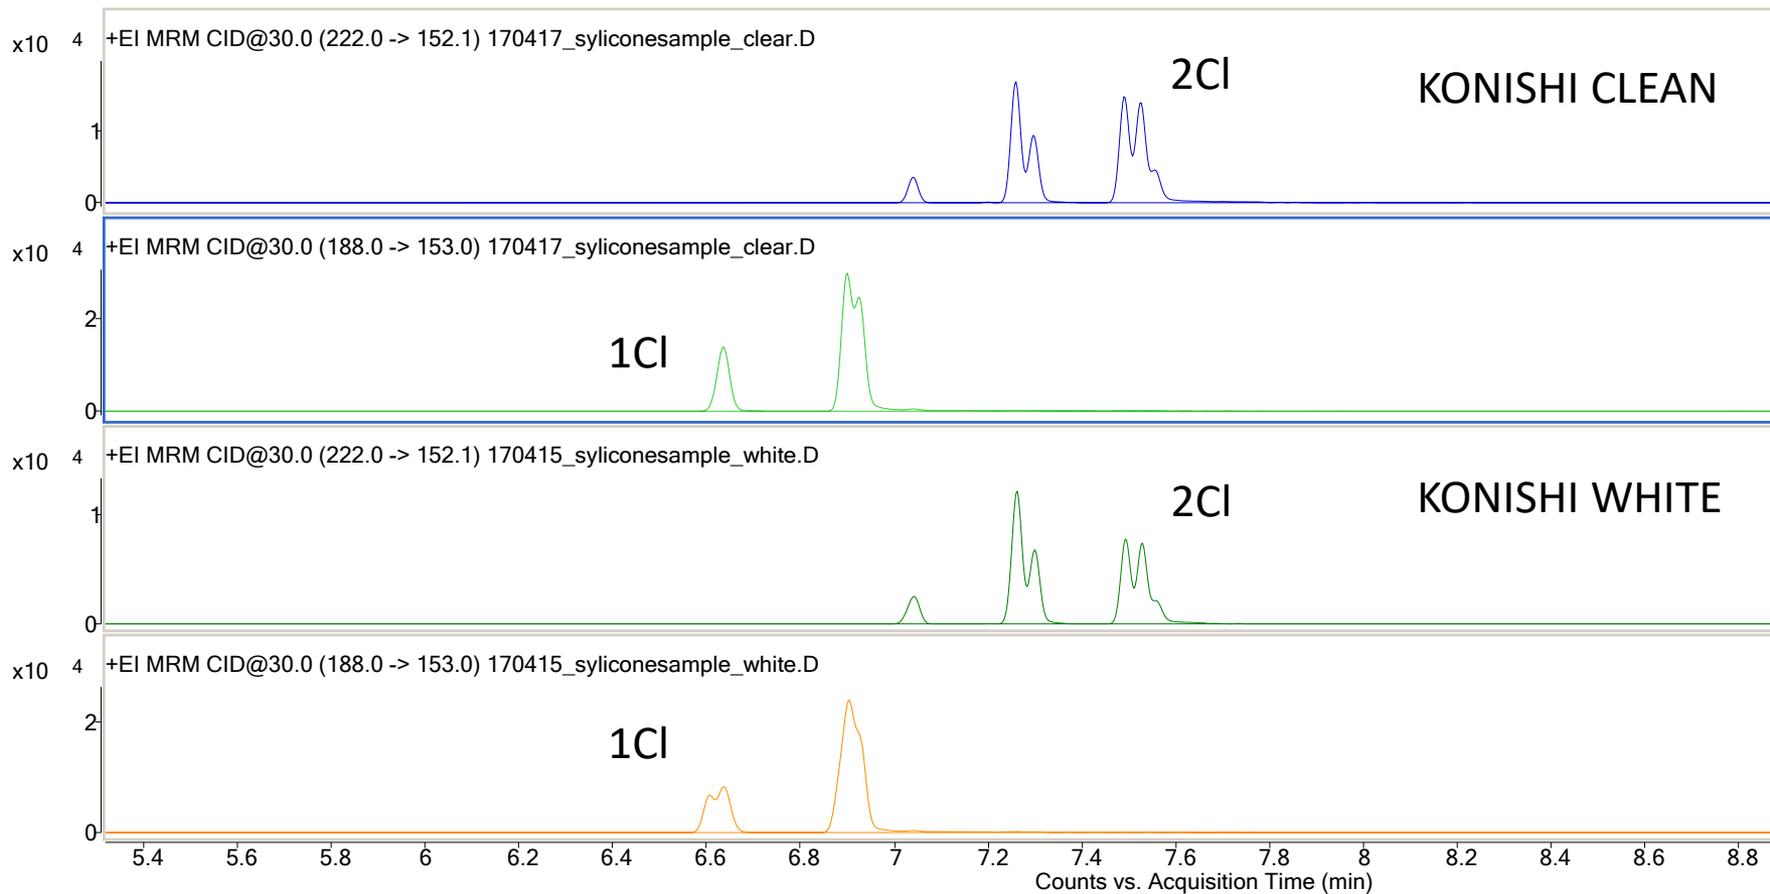

^b Center for Advanced Science and Innovation, Osaka University, Osaka, Japan

- PCB in **silicone-based adhesives** and **chlorophenylsilanes**
- Congener profiles in adhesives and chlorophenylsilanes : --
----- > quite **similar**
- High PCBs were detected in dichlorodiphenylsilane.

- **Similar Congener profiles** were come from the **chlorobenzene** used for chlorophenylsilanes manufacturing process.

-A report from the Japan Dyestuff and Industrial Chemicals Association (JDICA) revealed that **some organic pigments contained** a trace of polychlorinated biphenyl (**PCB**) **unintentionally generated** in their manufacturing process.

- In response to the report, the Ministry of Economy, Trade and Industry (METI) decided to immediately carry out an investigation into the actual situation and, as an urgent measure for the time being, instruct entrepreneurs to **stop manufacture, import or shipment** of organic pigments found to contain PCB over the international standard (**50ppm**).
